

cDL - communication Data Link

Interfacing TDMS with
external hospital information systems (HIS)

Cardioprotective Haemodialysis **SPOT**

Designed with you in mind, for seamless Therapy Data Management System (TDMS) interconnection with an existing hospital information system (HIS).

Efficient management of patient and treatment data starts with the correct information being available in the right place at the right time.

The primary function of cDL is to facilitate and process bidirectional communications between the Therapy Manager and the HIS, ensuring quality and efficiency.

Developed exclusively for application in a medical environment, no additional set-up programming is required.

Advantages for the administrator

Fresenius Medical Care middleware provides a number of advantages for clerical staff

- Resource optimisation
- Data protection
- Transparency
- Flexibility
- Product simplicity

Advantages for the clinical staff

Improving the experience of patients and clinical staff alike

- Optimised treatment
- Optimised patient safety
- Optimised patient care

cDL - communication Data Link

Interfacing TDMS with external hospital information systems (HIS)

Resource optimisation

Reduces administration by eliminating the need for data to be stored in multiple databases.

Data protection

Data stored only in secure TDMS database and HIS.

Transparency

Relevant data is available to all users at their respective interfaces.

Flexibility

Uses standard HIS protocols, but can be configured to comply with local systems.

Product simplicity

Minimal maintenance and no custom installation required.

Optimised treatment

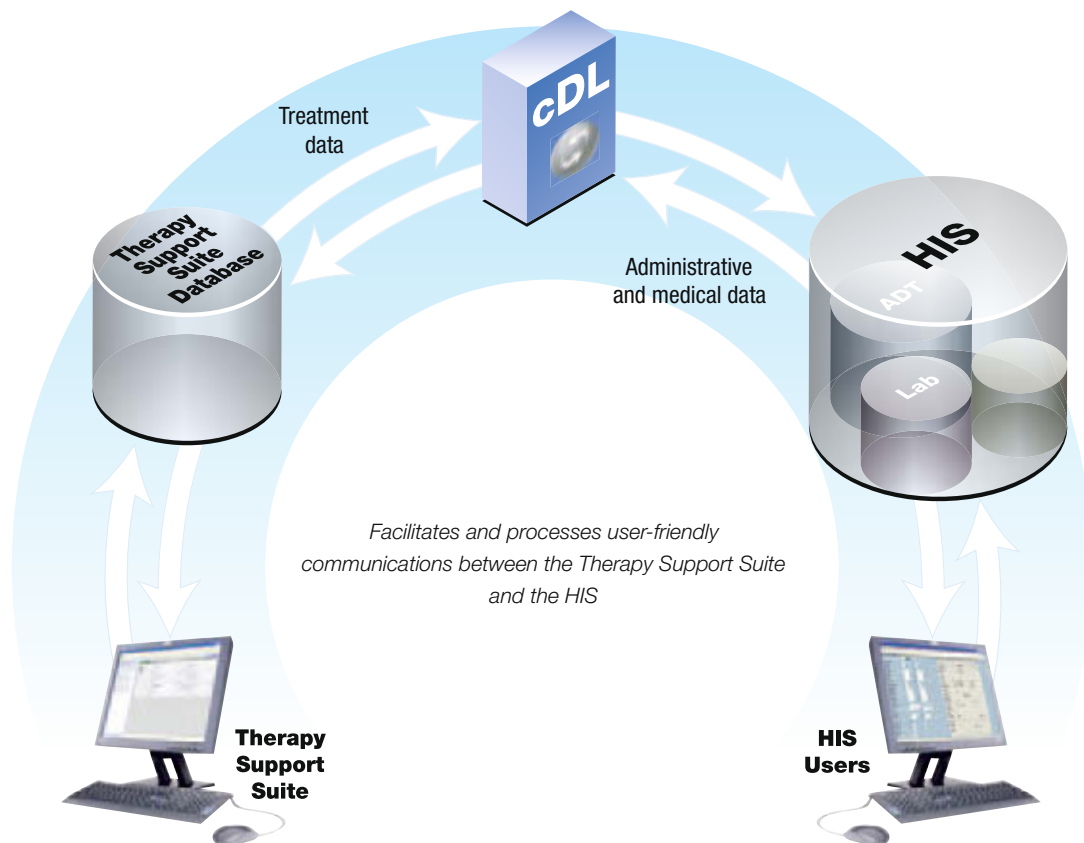

Improved availability of comprehensive patient data and just-in-time lab results.

Optimised patient safety

Eliminates mistakes arising from manual data inputting.

Optimised patient care

Reduced administration allows more time for patient care.
